YBS… high performance call routing and billing… prepaid billing… post-paid billing… calling cards… Through 2006, we developed YBS – a high performance voice call routing and billing solution. YBS has capabilities to handle prepaid and post-paid billing.

YBS, in addition, has a built-in calling card module with necessary features to manage a calling card service. YBS is currently in production use in a number of installations in the United States by providers of VoIP based telephony services.

… currently in production use … by service providers in the United States ... YBS has, in addition, been used to bill value-add services such as SMS and IVR content.YBS’ use ranges from a large scale telephone operator to smaller uses such as call centres. In addition to Voice over Internet Protocol (VoIP) protocols, YBS supports traditional telephone network technologies such as Digital technologies (ISDN PRI, ISDN BRI) and Analogue technologies (FXO and FXS). ... seamless interconnection with traditional telephony protocols… ISDN PRI… ISDN BRI… VoIP… cost effective migration from traditional telephony systems! YBS seamlessly interconnects VoIP networks with traditional telephone networks, which is key for cost effective migration from traditional telephony systems.YBS was built to scale from the smallest setups of a couple of users to large telecom grade setups with millions of users.
